NOOR HADDAD

AI Community and InnerSource Leader | Developer Platforms, Contribution Models, Reuse at Scale
New York, NY (Hybrid) | noor.haddad@example.com | (212) 555-0174 | linkedin.com/in/noorhaddad-example

SUMMARY

InnerSource and AI community leader with 14 years across open-source program leadership, developer relations, and developer platform product management. Built the internal open-source program for AI assets at a global asset manager, growing a trusted repository of 420 reusable AI components, agent skills, prompt assets, and evaluation patterns used by 61 teams. Combines engineering fluency (former software engineer, hands-on with agents, retrieval, and evaluation) with developer platform product judgment and the organizational influence to make contribution a recognized form of technical impact. Favors lightweight governance, visible wins, and community rituals that make sharing feel prestigious, practical, and safe.

CORE SKILLS

InnerSource and open-source program leadership, contribution workflows and models, code review and documentation standards, component ownership and maintainer models, quality tiers and release practices, lightweight governance, developer platform product management, discoverability and trust signals, sandbox environments, contributor onboarding pathways, community rituals (office hours, showcases, working groups), recognition and incentive design with HR, executive sponsorship, adoption and reuse measurement.

AI and engineering: agents and reusable agent skills, prompt assets and prompt versioning, retrieval-augmented generation, evaluation patterns and eval harnesses, workflow automation, production AI risk controls, Python, TypeScript, Git, GitHub Enterprise, Backstage, CI/CD, Slack, Confluence.

PROFESSIONAL EXPERIENCE

Head of InnerSource and AI Community | Halden Rowe Investments (global asset manager, $480B AUM) | New York, NY | March 2022 to Present

Specified and built the firm's internal open-source mechanism for AI assets: GitHub Enterprise source control, contribution workflows, documentation standards, CODEOWNERS-based ownership, three quality tiers (Experimental, Verified, Production Ready), and semantic release practices.

Created a searchable, trusted repository of 420 AI software components, agent skills, prompts, workflows, reference architectures, evaluation patterns, and reusable data-access patterns, now used by 61 teams across five business units.

Established an isolated AI sandbox with synthetic market data where practitioners explore, test, adapt, and demo reusable components before production, cutting time from discovery to first working prototype from 3 weeks to 4 days.

Designed and launched an AI-driven intake inbox that maps business requests to existing assets, maintainers, and candidate reuse paths; 58 percent of 900+ requests in its first year were resolved by reusing or extending an existing asset.

Built the community forum, Slack channels, weekly office hours, monthly showcases, four working groups, and a contributor onboarding path that took the contributor base from 12 to 340 practitioners.

Kindled early adoption through three targeted pilots with executive sponsorship from the CTO and Head of Investment Technology, internal storytelling, and contributor spotlights.

Partnered with HR and engineering leadership to add contribution, maintenance, and mentorship to promotion criteria and launched a quarterly Craft Awards program; 70 percent of maintainers say contribution is now recognized in reviews.

Worked with security and model risk partners on a lightweight review path that cleared Verified assets in 5 business days instead of 6 weeks, without adding approval layers.

Measured adoption, reuse, contributor health, asset quality, time saved, and duplication avoided; reuse avoided an estimated 38 duplicate builds and saved about 21,000 engineering hours in 2025.

Open Source Program Office Lead | Corvane Systems (developer infrastructure, Series D) | New York, NY | January 2019 to February 2022

Led the open source program office across 140 public repositories and an internal InnerSource program for 900 engineers, defining contribution guides, maintainer ladders, code review norms, and release governance.

Introduced trust signals (health badges, ownership metadata, freshness checks) that raised the share of repositories meeting documentation standards from 34 to 91 percent.

Grew external contributors 4x and ran a mentorship program pairing new contributors with maintainers, lifting first-time contributor retention from 22 to 47 percent.

Senior Product Manager, Developer Platform | Ardent Cloud | San Francisco, CA | June 2015 to December 2018

Owned the internal developer portal and service catalog used by 2,300 engineers, focusing on discoverability, onboarding, and documentation; cut median time to first deploy for new engineers from 9 days to 2.

Shipped reusable templates and golden paths that became the default for 80 percent of new services.

Developer Advocate, then Software Engineer | Brightline Labs | Boston, MA | July 2011 to May 2015

Wrote production Python services for three years, then moved into developer advocacy, running workshops, sample apps, and community programs for a 25,000 member developer community.

COMMUNITY AND SPEAKING

Maintainer, InnerSource Commons patterns working group. Speaker at InnerSource Summit and All Things Open on governance that scales without bureaucracy. Mentor, Write the Docs NYC.

EDUCATION AND ADDITIONAL

B.S. Computer Science, Rutgers University. Comfortable working across New York and San Ramon offices on a hybrid schedule.
